Awarding Body: Arden University

Programme Name: Health and Care Management

Module Name (and Part if applicable): Digital Health Leadership

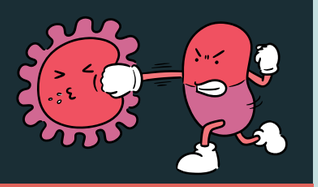

Assessment Title: Proposal Pitch

Student Number: [redacted]

Tutor Name: [redacted]

Word Count: 832 Words

DIGITAL HEALTH AND CARE INITIATIVE PITCH

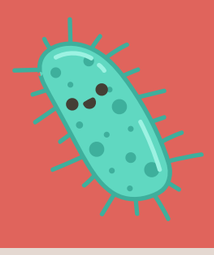

The objective of this pitch is to raise awareness of a Digital Healthcare initiative tool that can reduce the risk of infection in individuals with leukopenia.

Throughout this pitch, a digital health and care initiative tool regarding an aspect of health and social care service delivery will be introduced and critically analyzed. The problem to be solved in this pitch is the high risk of infection in individuals with leukopenia.

Leukopenia is characterized by a low amount of white blood cells, or leukocytes, in the blood (Varma, 2023). A low white blood cell count may increase a person's vulnerability to illness (Varma, 2023). As per Soliman's (2023) findings, leukopenia can be caused by several factors such as blood cell or bone marrow conditions, cancer treatments, congenital problems, and autoimmune disorders. In some situations, the infection might progress to a potentially fatal disease known as sepsis (DIVYA , 2022). Immunocompromised people with leukopenia are at a significant risk of sepsis from a simple infection (DIVYA , 2022), therefore it is important to attempt to avoid it as much as possible.

LeukoLink in detail

Leukopenia patients should avoid infections in hospitals and healthcare facilities since they are more susceptible to infections (Soliman, 2023); therefore, *LeukoLink* will help reducing infection risk.

Mhealth Apps - Applications that assist with diagnosis and clinical decision making (Rowland et al., 2020).

LeukoLink will provide patients with virtual check-ups, a way for doctors and patients to communicate, a calendar showing all of the upcoming doctor visits, and a way to track prescriptions and medication schedules. Additionally, *LeukoLink* will provide a quick and simple approach to visit the hospital without having to wait in a waiting area.

Additionally, connected devices like smart watches will support *LeukoLink* allowing patients to self-monitor. This will allow patients to see if everything is fine with them, and if something is not right, they will be able to speak with doctors without leaving their home and increasing their chances of contracting a deadly infection.

The use of mHealth technology has shown promise in the management of diabetes and cardiovascular disease, prevention of disease, and lifestyle modifications.

In summary, it appears that mHealth can support behavioral improvements, but additional research is required in this particular field (Changizi and Kaveh, 2017).

LeukoLink The Digital Health Tool

A medical app that can change everything!

Before going into detail about the app and how it will be useful, what is Digital Health and what are its current impacts in the healthcare sectors?

The term "digital health" seeks to enhance patient care by utilizing technological tools like artificial intelligence, telemedicine, mobile health, and electronic health records (Mumtaz et al., 2023).

Abernethy et al. (2022) state that implementing digital health tools will improve treatment and diagnosis, guarantee continuity of care, enable telemedicine for off-site patient appointments, and lower errors in the healthcare delivery system.

***LeukoLink* The Mobile Health App**

- Quick hospital appointment access;
- A place to view upcoming appointments; and treatment plan status;
- A medication schedule and tracker;
- Virtual check-ups and doctor-patient communication;

***LeukoLink* Goals:**

1. Limited external contact with access to medical staff for additional assistance if required;
2. A simple method to monitor medication intake;
3. When at the hospital for an appointment, you can skip the waiting room;

Benefits and Risks

Healthcare providers as well as patients benefit from the implementation of digital health.

Using *LeokoLink* will allow to get patient's health data more quickly and easily. Additionally, it helps medical professionals access medication, medical databases, and test results instantly. Furthermore, by enabling easy remote communication between doctors and patients, *LeokoLink* can contribute to a more efficient medical workflow.

Benefits	*Risks*
Easier to gather patient's health data (Designveloper, 2023)	Hard to be validated by clinics (Ronquillo et al. 2023)
Decreases preventable medical errors (Designveloper, 2023)	New to industry and with not enough research (Ronquillo et al. 2023)
Facilitates patient-doctor communication (Designveloper, 2023)	Data privacy and security risks remain unaddressed (Ronquillo et al. 2023)

To overcome these challenges/risks, it is essential to utilize a problem-centered approach, involve all relevant stakeholders, budget appropriately, standardize procedures and resources, build an evaluation framework, and offer users with training and support throughout the transformation process (Mumtaz et al., 2023).

Stakeholders analysis + Policies + Data protection

Healthcare stakeholders are indispensable for funding, shaping strategy, and providing innovative solutions to the industry (Kimberley, 2022).

The three 'Ps' (patients, professional providers, and policymakers) are the most essential stakeholders in healthcare (Kimberley, 2022).

Information shared (stakeholders):

- Information about the diagnosis;
- Treatment Plan, including dosages of medication and schedules;
- Information related to self-care measures and caregiver information;

The application will provide encryption features for information collection, exchange, and storage. It offers tools for managing passwords (Llorens-Vernet et all., 2020). Users' credentials are safeguarded and their data is accessed through permission and authentication processes. It restricts access to information that the user needs exclusively (Llorens-Vernet et al., 2020).

Clear communication is critical for controlling leukopenia, promoting collaborative behaviour, and improving patient outcomes(Trappett, 2023).
